

# Netgraph – a Tool for Searching in the Prague Dependency Treebank 2.0

Defence of the Doctoral Thesis, Prague, September 3<sup>rd</sup>, 2008

---

**Author:** Mgr. Jiří Mírovský

Charles University in Prague, Institute of Formal and Applied Linguistics

**Supervisor:** Prof. RNDr. Jan Hajič, Dr.

Charles University in Prague, Institute of Formal and Applied Linguistics

**Opponents:** RNDr. Roman Ondruška, Ph.D.

SUN Microsystems

Ing. Alexandr Rosen, Ph.D.

Charles University in Prague, Institute of Theoretical and Computational Linguistics

# *The Starting Point*

---

Three sides existed whose connection needed to be solved:

- ➡ The Prague Dependency Treebank
- ➡ Netgraph 1.0
- ➡ Users without programming skills

# *The Work*

---

The doctoral thesis consists of these main parts:

- ➔ Analysis of the Requirements
- ➔ Designing the Query Language
- ➔ Usage of the Query Language
- ➔ Comparison to Other Search Systems
- ➔ Implementation in Netgraph

# *The Work*

---

In this presentation, I will focus on these parts:

Analysis of the Requirements

Designing the Query Language

Usage of the Query Language

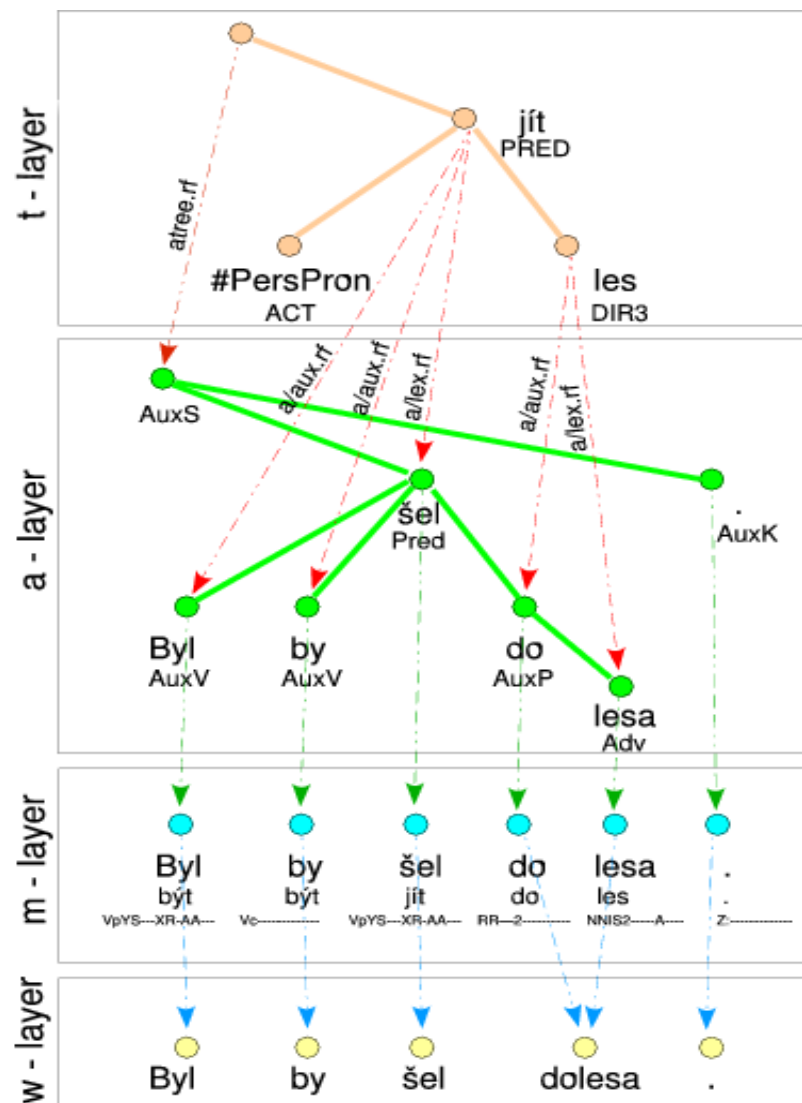

Comparison to Other Search Systems

Implementation in Netgraph

# Prague Dependency Treebank 2.0

## *Layers in PDT 2.0*

# Linguistic Requirements

## *Valency*

---

To study valency, the query language should be able to:

- ➔ control a presence of a particular type of son
- ➔ control a non-presence of a son
- ➔ control number of sons

# Linguistic Requirements

## *Coordination etc.*

---

Tree dependency is not always linguistic dependency. We need:

 to skip a node (etc. coordination, apposition)

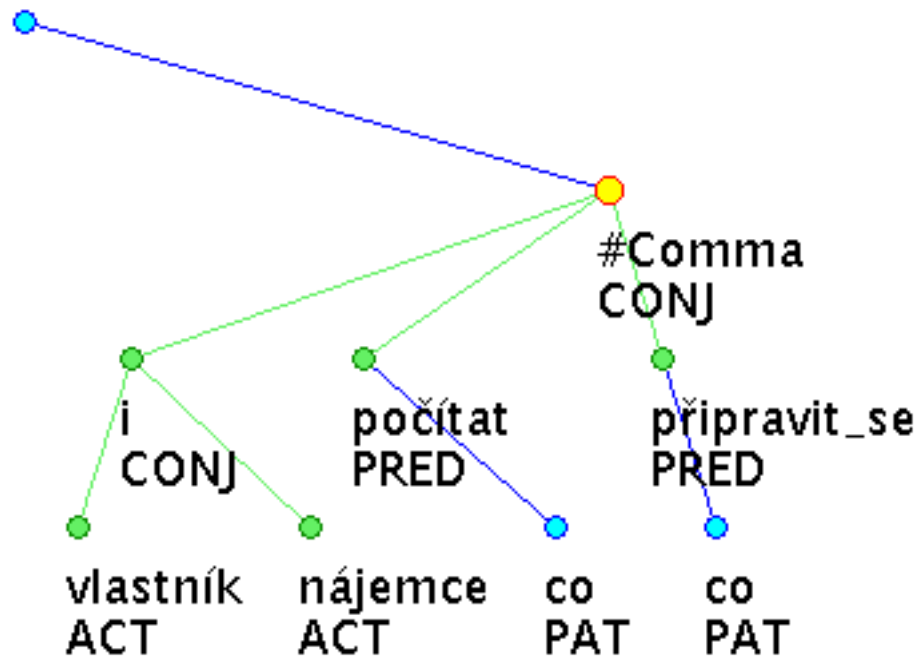

# Linguistic Requirements

## *Complex Example of Coordination*

---

Czech: S čím mohou **vlastníci i nájemci počítat**, na co by se měli **připravit**?

English (lit.): What can **owners and tenants expect**, what they should **get ready** for?

# Linguistic Requirements

## *Coordination etc.*

---

Tree dependency is not always linguistic dependency. We need:

➔ to skip a node (etc. coordination, apposition)

➔ even better: to set a linguistic dependency

# Linguistic Requirements

## *Predicative Complement*

---

Czech: Ze světové recese vyšly jako jednička Spojené státy.  
English: The United States emerged from the world recession as number one.

# Linguistic Requirements

## *Predicative Complement*

---

The dual dependency is represented by means of a **reference** to another node (attributes `compl.rf` and `id`). We need:

to match values unknown at the time of creating the query

# Linguistic Requirements

## *...other phenomena*

---

- ➔ *Topic – Focus, Focus proper* – combination of references, non-existence of a node and transitive closure of dependency; relation “<”
- ➔ *Rhematizers* – closest left son, closest left brother
- ➔ *(Non-)projectivity* – multiple-tree query to combine several one-tree queries representing different orientations of non-projective edges

# Linguistic Requirements

## *...other phenomena*

---

- ➔ *Idioms etc.* – searching in the linear form of the sentence (with regular expressions)
- ➔ *Agreement* – reference to only a part of a value of an attribute of another node (e.g. the fifth position of the morphological tag for case)
- ➔ *Word order* – measuring the horizontal distance between words

# Linguistic Requirements *Layers in PDT 2.0*

# Linguistic Requirements

## *Accessing Lower Layers*

---

Queries across the layers of annotation:

- A **PAT**ient expressed with a preposition **k** and a noun in the dative
- A **PAT**ient more dynamic than an **ACT**or but on the left side from it in the sentence

We need to have means of accessing the lower layers.

# Linguistic Requirements

## *Summary*

---

### *Evaluation of a node*

- multiple attributes evaluation
- alternative values
- alternative nodes (alternative evaluation of the whole set of attributes)
- wild cards (regular expressions)
- negation, relations other than “equal to”

# Linguistic Requirements

## *Summary*

---

### *Dependencies between nodes (vertical relations)*

- direct, transitive (existence, non-existence)
- vertical distance (from root, from one another)
- number of sons (zero for leaves)

# Linguistic Requirements

## *Summary*

---

### *Horizontal relations*

- precedence, immediate precedence
- negation of it
- horizontal distance

### *Secondary relations*

- secondary dependencies, coreferences

# Linguistic Requirements

## *Summary*

---

### *Other features*

- multiple-tree queries
- accessing several layers of annotation at the same time
- searching in the linear form of the sentence

# Netgraph Query Language

## *The Basics*

---

# *Netgraph Query Language*

---

Main additions to the query language of Netgraph 1.0:

- ➡ Meta-attributes
- ➡ References to attributes of other nodes
- ➡ Multi-tree queries
- ➡ Hidden nodes for a multilayer access

# Netgraph Query Language

## *Meta-Attributes*

---

Attributes not present in the corpus,  
treated like normal attributes:

- **\_transitive** (*transitive edge*)
- **\_optional** (*optional node(s)*)
- **\_#sons** (*number of sons*)
- **\_#hsons** (*number of hidden sons*)
- **\_#descendants** (*number of nodes in the subtree*)

# Netgraph Query Language

## *Meta-Attributes*

---

- **\_#lbrothers** (*number of left brothers*)
- **\_#rbrothers** (*number of right brothers*)
- **\_depth** (*distance from the root*)
- **\_#occurrences** (*exact number of a particular type of sons/descendants*)
- **\_name** (*label of a node for references*)
- **\_sentence** (*linear form of the sentence*)

# Using the Query Language

## *Valency*

---

one **ACT**or, one **PAT**ient,  
no other sons

at least one son (**ACT**or),  
no **PAT**ient

# Using the Query Language

## *Predicative Complement*

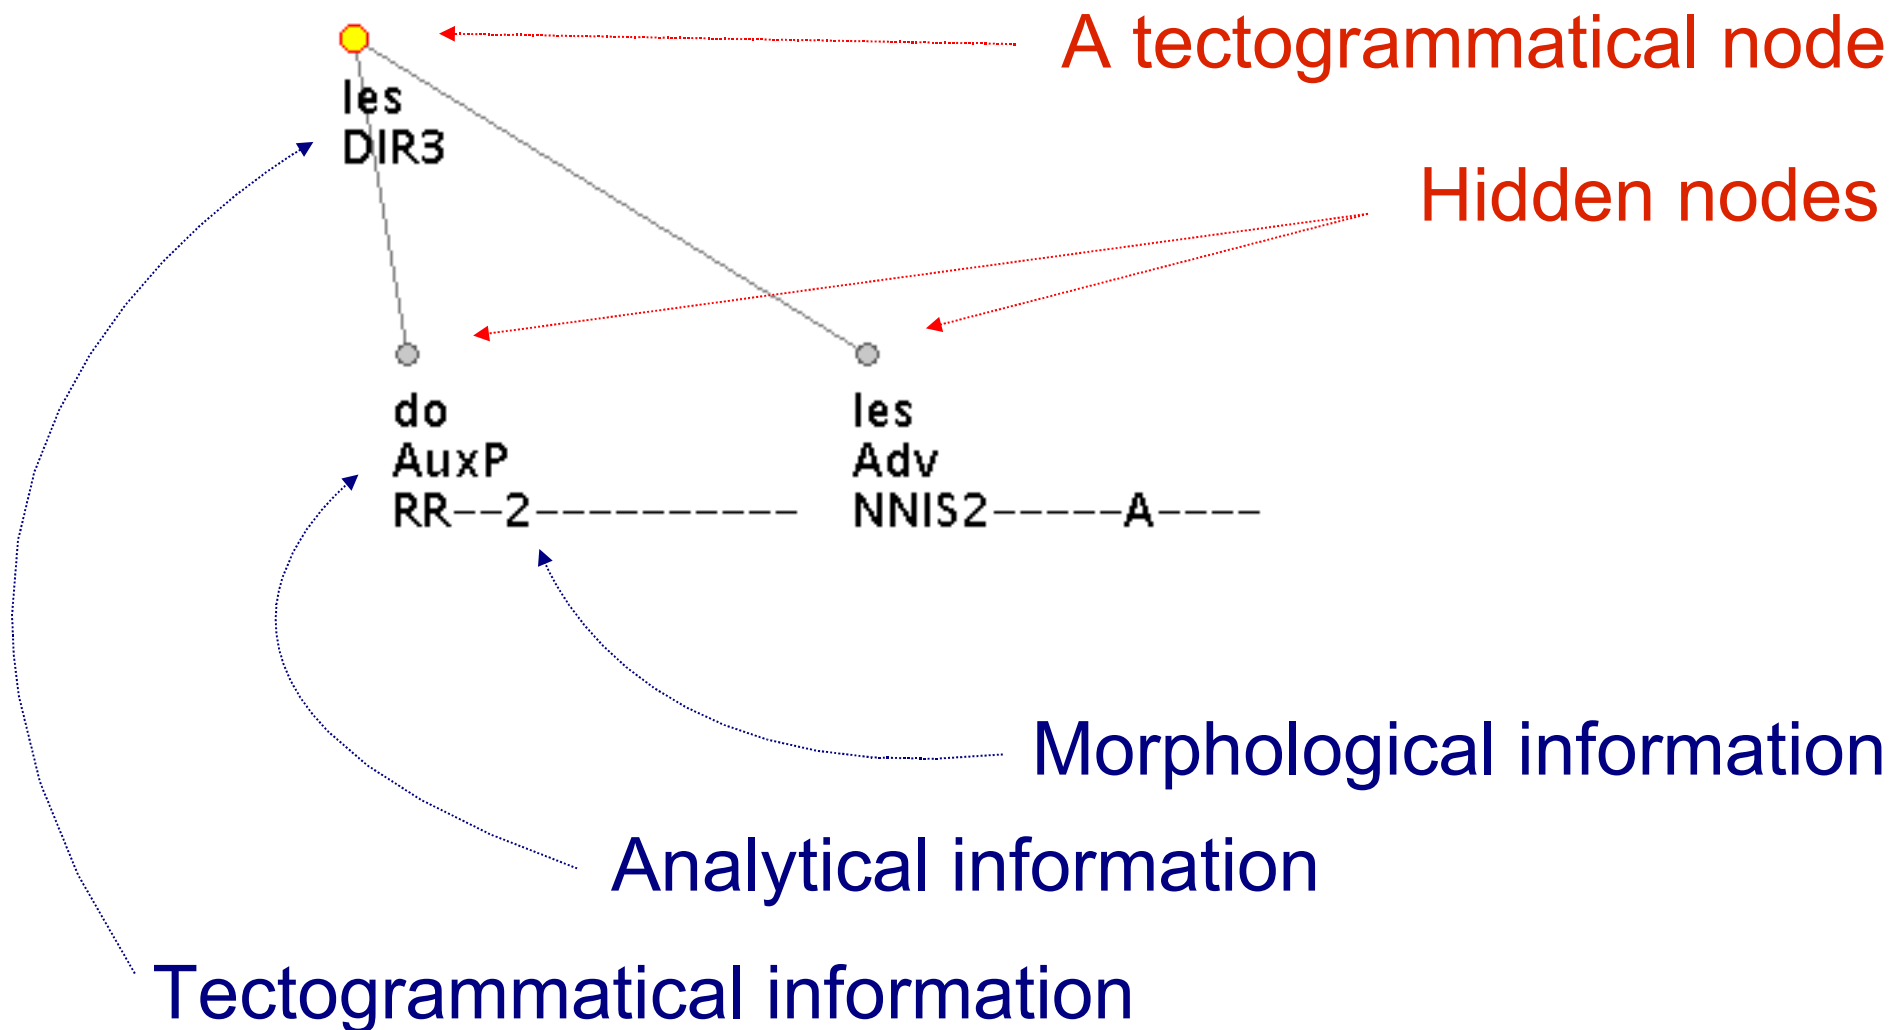

---

- a nominal predicative **COMPL**ement  
with second dependency on a **PAT**ient

# Netgraph Query Language

## *Hidden Nodes*

# Using the Query Language

## *Hidden Nodes – A Query*

---

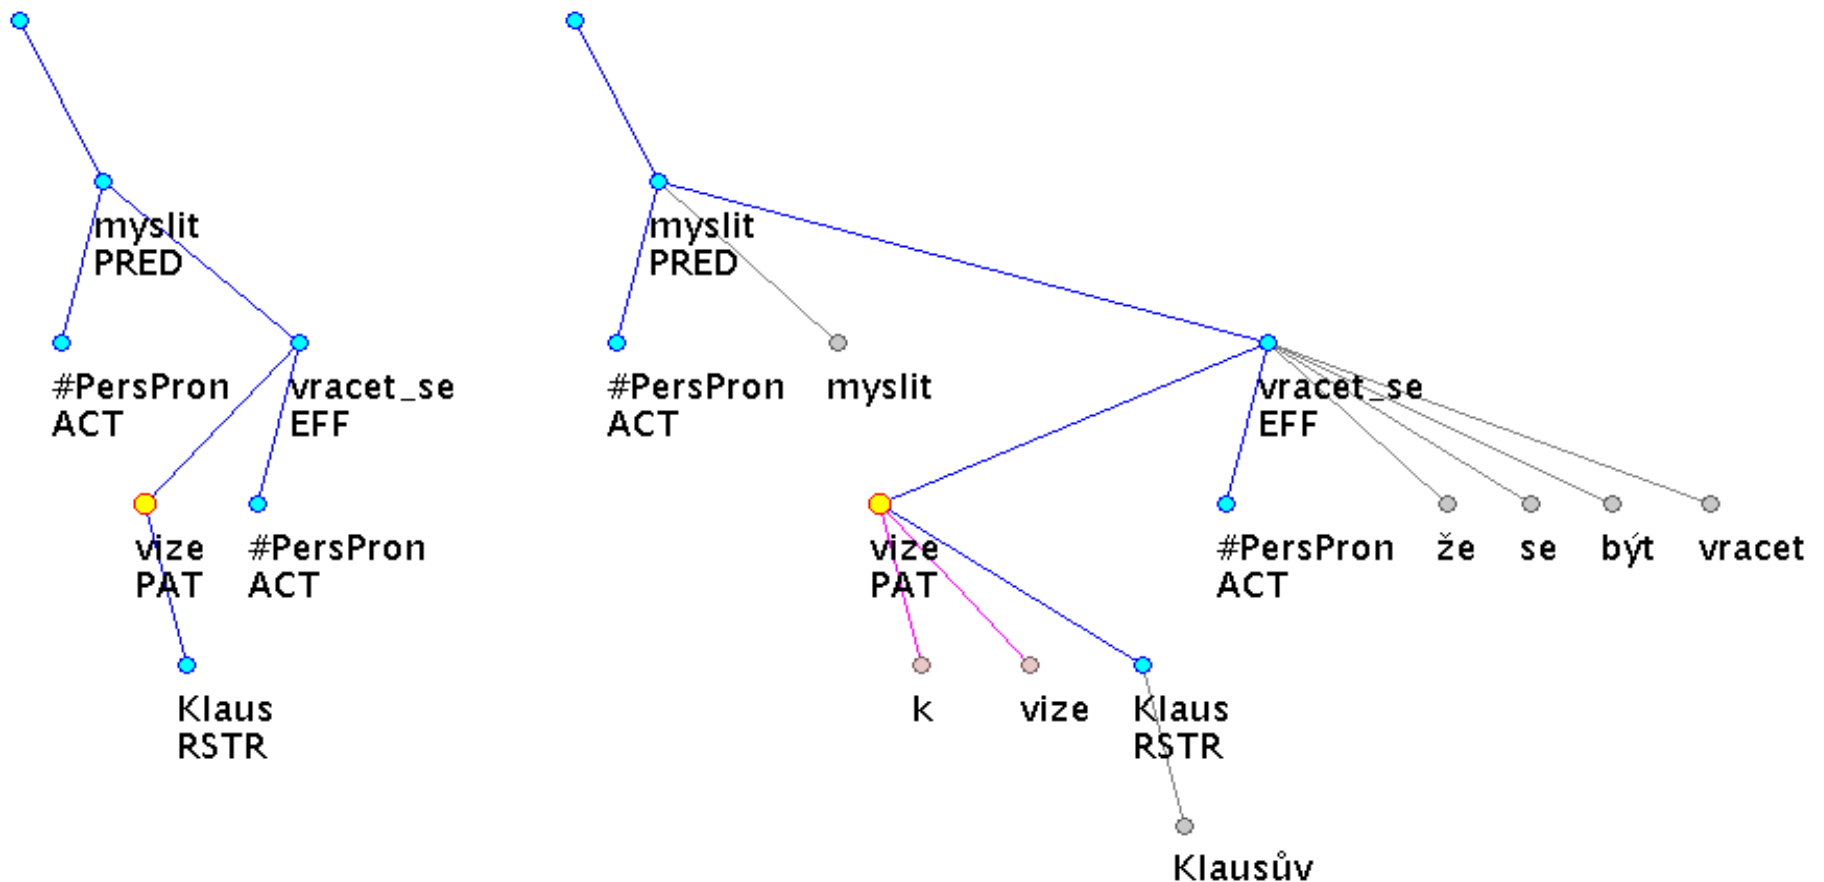

- a **PAT**ient expressed with a preposition **k** and a noun ("**N...3.\***") in the dative ("**N...3.\***")

# Using the Query Language

## *Hidden Nodes – A Result Tree*

Czech: Myslím, že ke Klausově vizi se budeme vracet.  
English: I think that we will get back to Klaus's vision.

# *Comparison to Other Tools*

---

A detailed comparison to the query languages of the three following search tools has been done:

- ➔ Netgraph > TGrep (Pito 1994)
- ➔ Netgraph ~ TGrep2 (Rohde 2005)
- ➔ Netgraph ~ TigerSearch (Brants et al. 2002)

# *Netgraph As a Tool*

---

Main extensions to the tool since version 1.0:

- ➡ Graphical creation of the query
- ➡ Chained queries
- ➡ Inverted matching
- ➡ Displaying context trees
- ➡ Removing trees from the result

# *Usage of the Query Language*

---

Analytical trees: October 2002 – March 2008

Tectogrammatical trees: February 2005 – March 2008

<b>Number of:</b>	<b>Total</b>	<b>Analytical Trees</b>	<b>Tectogrammatical Trees</b>
all queries	16 870	10 299	6 571
one-node queries	10 146	7 180	2 966
structured queries (more than one node)	6 724	3 119	3 605
queries without a meta-attribute	15 575	9 989	5 586
queries with a meta-attribute	1 295	310	985
queries with a reference	363	110	253
queries with a hidden node	1 194	-	1 194

# Netgraph 1.93

The screenshot displays the Netgraph 1.93 (10.4.2008) application window. The interface is organized into several functional areas:

- global head:** Contains a list of attributes on the left, including 'eparents', 'eparents\_diff', 'functor', and various 'gram/' prefixed attributes. A central comparison operator panel allows selection of operators like '=', '!=', '<', '<=', '>', and '>='. To the right, a 'possible values' list shows 'ACMP', 'ACT', and 'ADDR', with 'ACT' selected. Below this is a 'reference' field set to 'atree.rf' and a 'value' field set to 'ACT'. Buttons for 'set', 'add', 'x', 'set RE', and 'add RE' are provided.
- query tree:** A diagram showing a blue node labeled 'functor=PRED' connected to a yellow node labeled 'functor=ACT'.
- factory:** A panel with buttons for 'new query []', 'add tree )[]', 'subtree ([])', 'father []φ', 'brother ,[]', 'alternate node [[]]', and 'remove node'. A 'name node:' field contains 'N1'. Additional buttons include 'undo', 'show the query tree', and 'and/or: AND'.
- query:** A text field containing the query '[functor=PRED]([functor=ACT])' with 'load' and 'save' buttons.
- history:** An empty text field with 'load', 'save', and 'clear' buttons.
- Control Panel:** A row of buttons: 'stop the query', 'first only' (checkbox), 'invert match' (checkbox), 'select trees by the query above result', 'select trees by the query', and 'select all trees'.
- Navigation:** A tabbed interface with 'Files', 'Query', 'Trees', and 'Debug' tabs.
- Status Bar:** Displays 'Files set OK.'

# Using the Query Language

## *Hidden Nodes – A Query*

---

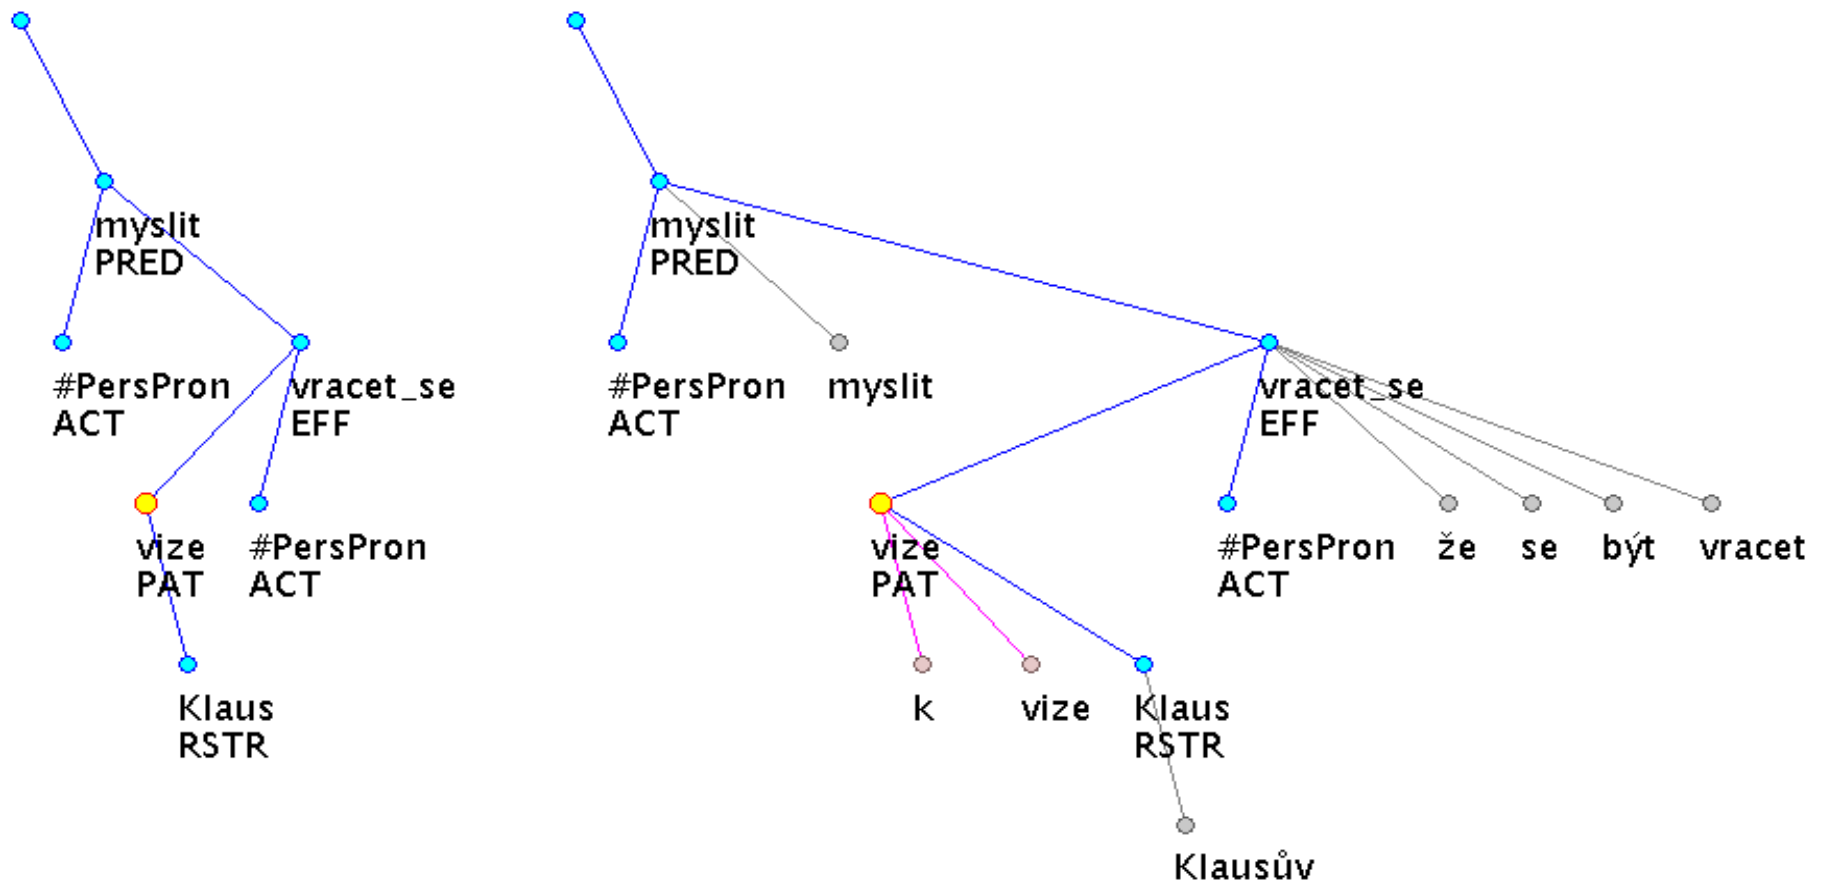

- a **PAT**ient expressed with a preposition **k** and a noun ("**N...3.\***") in the dative ("**N...3.\***")

# Using the Query Language

## *Hidden Nodes – A Result Tree*

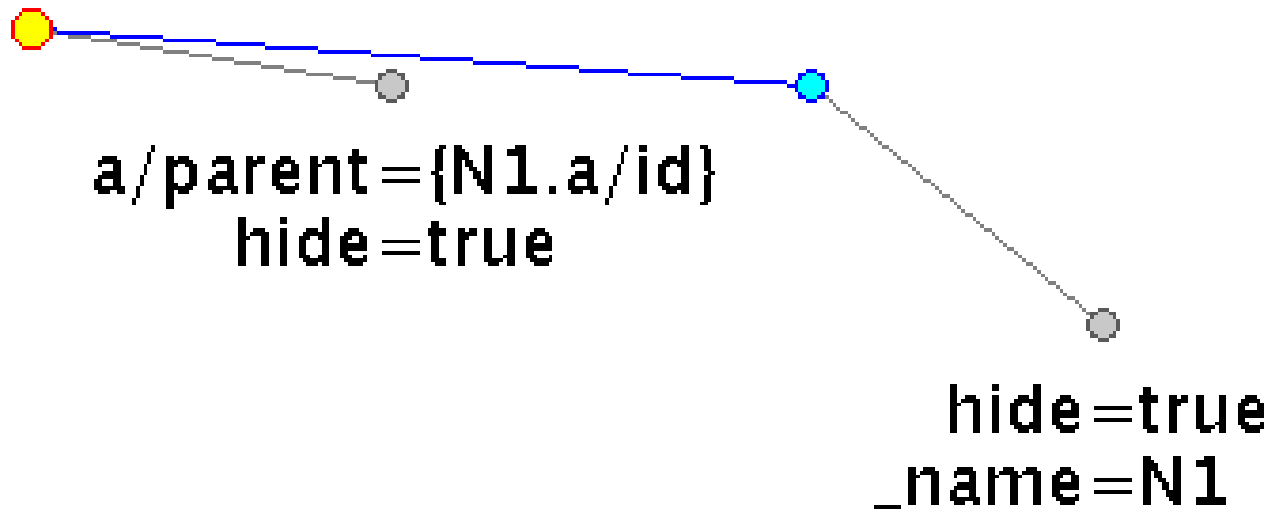

---

# Using the Query Language

## *Hidden Nodes – A Query*

---

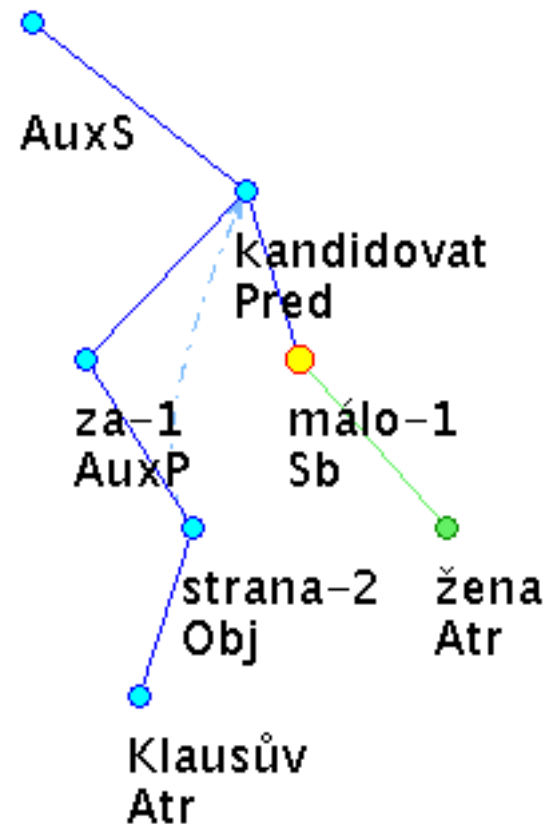

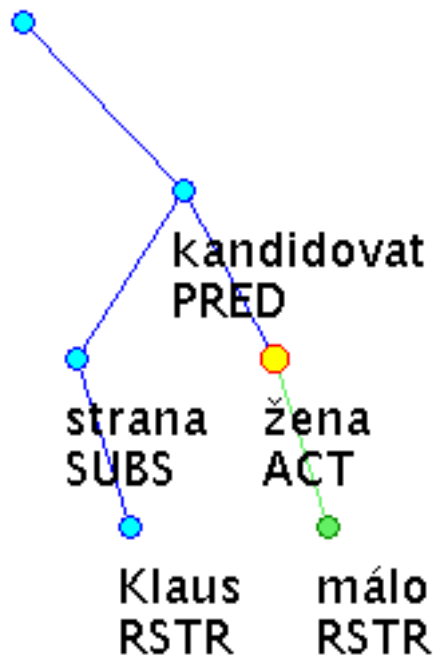

- an opposite dependency on the different layers

# Using the Query Language

## *Hidden Nodes – A Result Tree*

---

# Improvements to the Query Language

## *Structured Negation Today*

---

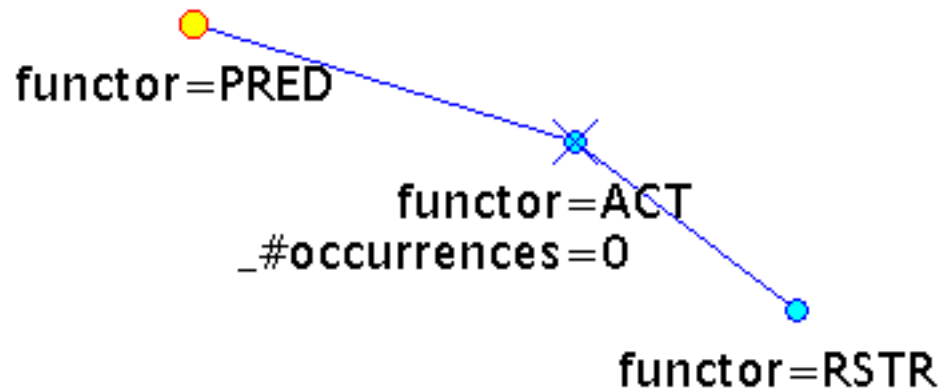

- a **PRED**icate that does not govern an **ACT**or that governs a **RSTR** (a multi-tree query with relation **AND**)

# Improvements to the Query Language

## *Structured Negation – a Possible Future*

---

- unclear meaning of the second query

# Improvements to the Query Language

## *Changing the Meaning of the Dependency*

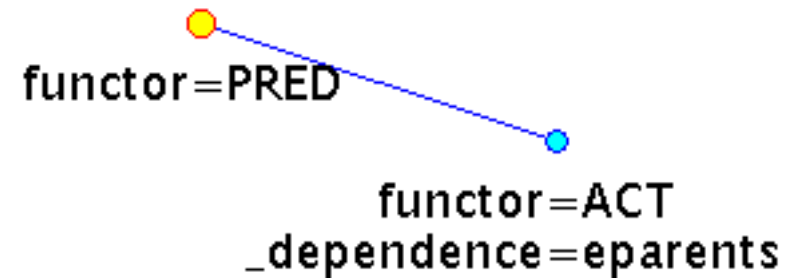

---

●  
functor=PRED  
\_name=N1

●  
eparents={N1.id}  
functor=ACT

●  
functor=PRED

●  
functor=ACT  
\_dependence=eparents

- a new meta-attribute **\_dependence** might change the meaning of the dependency

# Improvements to the Query Language

## *Changing the Meaning of the Dependence*

---

- combinations of meta-attributes have to be carefully thought over
